

3 Most Commonly Needed Auto Repairs

Although people generally go to auto services to get repairs, most of the time, they end up replacing one or several car parts such as oil filters, windshield wipers, tires, batteries, oxygen sensors, catalytic converters, ignition coils, thermostats, fuel caps, spark plugs, airflow sensors, EVAPs, and more. Below are fifteen of the most common auto repairs and replacements needed in Bountiful.

Oil Change and Filter Replacement

Most cars need their oil changed every three thousand miles or every six months, but it depends on the make and model of the automobile. Oil changes are unavoidable, as they contribute to the cleanliness and efficiency of the car's engine. Old motor oil may fill with dirt or even develop into a sludge. Dirt and debris can scratch and damage the inside of the engine, and as the engine has to fight the debris to perform properly, it uses more and more gas, decreasing the car's overall cost efficiency. If the oil turns into sludge, it is unable to draw heat from the engine. In this case, the engine is at risk of overheating, blowing a gasket, or seizing up. If the heat causes the engine's parts to warp, the engine must be completely replaced rather than repaired in Bountiful. Regularly replacing or repairing an automotive's oil filter allows for the oil to remain cleaner for longer and ultimately strengthens the engine's fuel efficiency.

Windshield Wiper and Fluid Replacement

Driving without a windshield wiper is not only dangerous, but it's also illegal. Windshield wipers serve as a windshield's goggles in weather such as rain, snow, sleet, hail, and more. Wiper fluid is also crucial when it comes to clearing visual hindrances such as dust, dirt, and mud. While on the road in Bountiful, especially a weather-compromised road, a driver simply can't afford to lose even a few seconds of visibility, which is why proper windshield wiper and fluid functioning and repairs are essential to auto safety.

Engine and Cabin Air Filter Replacement

Most manufacturers in Bountiful recommend that automobiles replace or repair their engine and cabin air filters once a year or approximately every fifteen thousand miles. The main purpose of a cabin air filter is to prevent dust and mold from entering the car, which makes dirty air filters fairly easy to

detect. Clogged cabin filters are unable to do their job, which manifests as moldy or musty smells when the air conditioning or heat is on. With enough air freshener, bad filters can be easy to ignore; however, they may reduce the engine's power output, resulting in an increased need for gas. Window fogging is another telltale sign that a car's cabin air filter needs to be changed or repaired. An engine air filter is designed similarly to a cabin air filter, but its primary purpose is to prevent dust and debris from entering the motor. Clogged engine filters may damage an automobile's engine, causing it to decrease in efficiency as dirt and particles build up inside.

Extreme Auto Service does [auto repairs in Bountiful](#), including oil replacements, spark plug replacements, and thermostat replacements.
